The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is useful for producing polyclonal or monoclonal antibodies. The polymucleotide is also useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 2; Page 46; 57pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
           This invention describes a novel sphingolipid desaturase that selectively C introduces a double bond into the sphingobase of the ceramide residue of sphingolipids and capnoids. A DNA sequence encoding the sphingolipid CC desaturase, or a vector containing the DNA sequence, can be used to produce transgenic plants, especially crop plants, with an increased or decreased delta-8 unsaturated long-chain base content or an altered delta-8 unsaturated long-chain base cis/trans ratio, especially to compensate for a delta-8-unsaturated long-chain base deficiency, to compensate for a delta-8-unsaturated long-chain base deficiency, to compensate for a delta-8-unsaturated bases, to increase tolerance corresistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms or caller size growth and flowering time. Cells, transgenic organisms or plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence encodes the Brassica napus sphingolipid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sphingolipid desaturase; sld1; sphingobase; ceramide; capnoid; transgenic plant; crop plant; delta-8-unsaturated long-chain b tolerance; resistance; soil salinity; ion stress; toxicity; dr cold; frost; phytopathogenic microorganism; flowering time; copharmaceutical; food; chemical raw material; ds.
                                                                                                                                                                                                                                                                                                                                                                                                    New sphingolipid desaturase that into sphingolipids and capnoids -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27-JUN-1998;

CC This invention describes a novel sphingolipid desaturase that selectively CC introduces a double bond into the sphingobase of the ceramide residue of csphingolipids and capnoids. A DNA sequence encoding the sphingolipid CC desaturase, or a vector containing the DNA sequence, can be used to CC produce transgenic plants, especially crop plants, with an increased or CC decreased delta-8-unsaturated long-chain base content or an altered CC delta-8-unsaturated long-chain base content or an altered CC compensate for a delta-8-unsaturated long-chain base deficiency, to CC exclude production of delta-8-unsaturated long-chain base deficiency, to CC conditions, cold or frost and/or phytopathogenic microase tolerance CC calter size growth and flowering time. Cells, transgenic organisms, or to CC alter size growth and flowering time. Cells, transgenic organisms or CC cand capnoids with unsaturated sphingolabases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw CC materials. This sequence encodes a sphingolipid desaturase protein contentials. This sequence encodes a sphingolipid desaturase protein contentials.

                            This invention describes a novel sphingolipid desaturase that selectively CC introduces a double bond into the sphingolase of the ceramide residue of sphingolipids and capnoids. A DNA sequence encoding the sphingolipid CC desaturase, or a vector containing the DNA sequence, can be used to CC produce transgenic plants, especially crop plants, with an increased or CC decreased delta-8-unsaturated long-chain base content or an altered CC delta-8-unsaturated long-chain base content or an altered CC compensate for a delta-8-unsaturated long-chain base deficiency, to CC exclude production of delta-8-unsaturated bases, to increase tolerance CC or resistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms, or to CC alter size growth and flowering time. Cells, transgenic organisms or CC plants containing the DNA sequence can be used to produce sphingolipids and as chemical raw can be used in cosmetics, pharmaceuticals and foods and as chemical raw can be used in cosmetics, pharmaceuticals and foods and as chemical raw can be used in cosmetics, pharmaceuticals and foods and as chemical raw can be used in cosmetics, pharmaceuticals and sphingolipid can be used in cosmetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sphingolipid desaturase; sld1; sphingobase; ceramide; capnoid; transgenic plant; crop plant; delta-8-unsaturated long-chain b tolerance; resistance; soil salinity; ion stress; toxicity; drodl; frost; phytopathogenic microorganism; flowering time; co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δ
                                                          The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising:

(a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and

(b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that with increased transpendence is stress regulated gene (ABZ12196-ABZ17574) used
                                                                                                                                                                                                                                                                                                                                                                         24-AUG-2000;
26-JAN-2001;
22-JUN-2001;
           Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office.
                                                   of an Arabidopsis thaliana stress regulated in methods of the invention.
                                                                                                                                                                                                          Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       isolated from a borage membrane-bound polysomal cDNA library using a partial clone, obtained from an EST database search, as probe. The borage delta-6 desaturase nucleic acid can be operably linked to the seed-specific 5' regulatory region (see AAX24916) of the Arabidopsis thaliana cleosin AES21 gene in clai expression cassettes of the invention. Transgenic plants, e.g. sunflower, soybean, maize, tobacco, cotton, peanut, oilseed rape or Arabidopsis are obtained that show increased levels of GLA or octadecatetraeonic acid. The levels of desirable fatty acids in oilseed crops can be manipulated to provide seed oils of use in human health and industrial applications.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A DNA clone (AAT30395) codes for borage delta-6-desaturase (AAR98455), which catalyses the conversion of linoleic acid to gamma-linolenic acid (GLA). It was isolated from a borage membrane-bound polysomal library using probes based on abundantly expressed seed storage protein cDNAs and with an isolated partial cDNA clone. The gene can be incorporated into a vector, pref. incorporating a tissue-specific promoter, for the expression of delta-6-desaturase in transgenic plants, esp. sunflower, soybean, maize, tobacco, peanut, carrot or oilseed rape, resulting in increased GLA prodn. Alteration of plant lipids may also lead to improved chilling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transgenic plants comprising the borage delta-6-desaturase gene show increased production of gamma linolenic acid and having increased resistance to chilling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1685 BP; 431 A;

The nucleic acid and a vector expressing the nucleic acid are useful for producing a plant such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant, with increased gamma linolenic acid (GLA) content, and also for inducing or increasing production of GLA in a bacteria or plant deficient, lacking in or producing low levels of GLA. The nucleic acid is also useful for inducing chilling tolerance in plants. This sequence encodes the borage delta6 desaturase involved in the production of gamma linoleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      10-OCT-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid encoding an evening primrose delta-6-desaturase polypeptide. The nucleic acid, a vector comprising the nucleic acid or a nucleic acid encoding delta-12-desaturase, is useful for producing a plant (such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or vector and regenerating a plant with increased GLA content from the plant cell, for inducing or increasing production of GLA in an organism lacking in or producing low levels of GLA and for inducing production of octadecatetraenoic acid in at least one of a plant deficient or lacking in or producing low levels of GLA and for inducing production of octadecatetraenoic acid, a bacterium which produces alpha-linolenic acid or a bacterium which established acid or a bacterium which exhibits a delta-15-desaturase activity on a GLA substrate. This sequence represents cDNA encoding a borage delta-6-desaturase polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1685
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example

                                                                                                                                                                                                                                                                                             The invention describes an isolated nucleic acid encoding an evening primrose Delta6-desaturase. The nucleic acid and a vector expressing the nucleic acid are useful for producing a plant such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant, with increased gamma linolenic acid (GLA) content, and also for inducing or increasing production of GLA in a bacteria or plant deficient, lacking in or producing low levels of GLA. The nucleic acid is also useful for inducing chilling tolerance in plants. This sequence encodes the evening primrose delta6 desaturase involved in the production of gamma linoleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           delta6-desaturase; sunflower; soybean; maize; tobacco; peanut; carrot; oil seed rape; gamma linolenic acid; GLA; chilling tolerance; gene; ds; evening primrose.

                                                                                                           The invention relates to a nucleic acid encoding an evening primrose delta-6-desaturase polypeptide. The nucleic acid, a vector comprising the nucleic acid or a nucleic acid encoding delta-12-desaturase, is useful for producing a plant (such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or vector and regenerating a plant with increased GLA content from the plant cell, for inducing or increasing production of GLA in an organism lacking in or producing low levels of GLA and for inducing production of octadecatetraenoic acid in at least one of a plant deficient or lacking in or producing low levels of octadecatetraenoic acid, a bacterium which produces alpha-linolenic acid or a bacterium which exhibits a delta-15-desaturase activity on a GLA substrate. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-OCT-1991;

/clone="The library Gm-r1070 is a sequence-driven, reracked set of 9,216 clones selected from cDNA libraries from various tissues and stages of development of soybean that represent 2,639 sequences from immature cotyledons, 1,770 from immature seed coats, 3,338 from flowers, and 869 from young pods. The 5' ESTs of the source clones from the different libraries was used to select singletons, or a representative of each contig, which were reracked corntig analysis to select unique genes was performed by the laboratory of Ernest Retzel, Center for Computational Genomics and Bioinformatics, University of Minnesota, http://www.cbc.umn.edu/ResearchProjects/Soybean/index.html
Reracking was performed by Genome Systems, St. Louis, http://www.cbc.umn.edu/ResearchProjects/Soybean/index.html
Reracking was performed by Genome Systems, St. Louis, http://www.cbc.umn.edu/ResearchProjects/Soybean/index.html
Reracking was performed by Genome Systems, St. Louis, http://www.life.uiuc.edu/biotech/keck.html Note: The Keck Center for Comparative and Functional Genomics, University of Illinois,
http://www.life.uiuc.edu/biotech/keck.html Note: The corresponding 5' EST from each clone in the Gm-r1070 library is listed in the 'OTHER EST' field. The detailed information on the source library for each clone can also be obtained by referring to the Genome Systems clone ID of the original cDNA library that is also listed under 'OTHER EST'."
